

Frozen evaluation: paired causal worlds and one-way evidence access

1 Within each policy evaluation

Sham and injury fork from one exact pre-event state.
Candidate and clone are evaluated separately on the same founders/worlds.

2 Candidate versus exact clone

Frozen aggregate = 80% trimmed central mean
+ 20% bottom-quartile mean across pair effects

3 One-way evidence gate

Three complete GPU executions measure numerical stability; founders/worlds, not reruns, are the ecological units.
